

React Project

Using the following api [REST Countries](#), create an app that makes the following:

- The goal is to create an app where user can have access to informations of a country in the world The data of the band is inserted by you on the code, and can be real or fictional
- In the first part User can select a region of the globe (Africa, Americas, Asia, Europe, Oceania)
- After selecting the region he wants, he can access all the countries from that region
- After selecting the country he can access information about that country
- Create the possibility to select/unselect countries. They should appear in a sidebar. All the insert/remove operations should use the Redux store
- Create a search field in both parts (main countries list and sidebar selected countries list)
